

AI Workflow Audit

Ghulam Qasim:

Purpose:

This workflow audit maps the recurring tasks I handle during a normal week across university study, my AI/ML internship, coding projects, teaching, and portfolio development.

The purpose is to identify where AI can save time, where I should collaborate with AI, where I should keep the task primarily human, and where a task is safe enough to automate.

I will use this audit to select three recurring tasks that I can test and improve through FL-02, FL-03, and FL-04.

#	Recurring task	Classification	Why
1	Studying difficult AI/ML concepts for university and internship work	Collaborate with AI	AI can explain concepts in simpler ways and give examples, while I need to understand and verify the concepts myself.
2	Preparing for university exams and solving important questions	Just me	I need to develop my own understanding and demonstrate my own knowledge, so AI should not replace my independent thinking.
3	Completing Fly Rank AI/ML internship assignments and understanding the requirements	Collaborate with AI	AI can help break assignments into steps and explain requirements, but I make the final decisions and verify the work.
4	Debugging Python, Pandas, scikit-learn, Flask, and Google Collab errors	Collaborate with AI	AI can quickly suggest causes and fixes, while I test the solution and make sure I understand the code.
5	Cleaning and preparing datasets for ML projects	Collaborate with AI	AI can suggest preprocessing steps and code, but I must inspect the data and

#	Recurring task	Classification	Why
			decide whether the transformation is appropriate.
6	Running EDA and analyzing patterns in datasets	Collaborate with AI	AI can help generate analysis code and suggest patterns to investigate, while I verify the results and interpretations.
7	Writing and improving documentation for my notebooks and projects	Delegate to AI with review	AI can create a first draft quickly, but I need to review it for accuracy and make sure it reflects what I actually did.
8	Organizing and formatting repetitive project files and outputs	Fully automate	These are repetitive, rule-based operations that can be handled by scripts or automation with low need for human judgment.
9	Building and improving my AI/ML projects	Collaborate with AI	AI can help brainstorm designs, write code, and troubleshoot, while I decide the project direction and verify the implementation.
10	Maintaining my GitHub project repositories	Delegate to AI with review	AI can help prepare README text, commit descriptions, and organization suggestions, but I should review changes before publishing.
11	Creating LinkedIn posts about my learning, internship, and projects	Delegate to AI with review	AI can turn my rough ideas into polished posts, but I should review the final wording so the post remains accurate and authentic.
12	Preparing teaching material and explanations for students at tuition	Collaborate with AI	AI can help create examples and simpler explanations, while I decide what my students need and check the accuracy.

#	Recurring task	Classification	Why
13	Planning my weekly study and internship workload	Collaborate with AI	AI can help organize tasks and suggest a realistic schedule, but I decide my actual priorities and commitments.
14	Deciding whether my final academic/project work is correct and ready to submit	Just me	I am ultimately responsible for the accuracy, originality, and quality of my submitted work.
15	Brainstorming ideas for portfolio and future AI/ML projects	Collaborate with AI	AI can generate and compare ideas quickly, while I choose ideas based on my interests, skills, resources, and goals.

Three Target Tasks for FL-02 to FL-04

Target Task 1: Debugging Python/ML/Colab Errors

What I will do

I will use AI when I encounter errors while working with Python, Pandas, NumPy, scikit-learn, Flask, or Google Colab.

I will provide the relevant error message, code, and context to the AI and ask it to identify the likely cause and suggest a fix.

Classification

Collaborate with AI

I will not blindly copy the suggested solution. I will test it, inspect the result, and make sure I understand why the solution works.

"Done well" means

- The error is resolved.
- The code runs successfully.
- The solution does not introduce a new error.

- I can explain the cause of the original error in my own words.
- The final solution remains appropriate for my project.
- I record the successful fix so that I can reuse the knowledge later.

Measurable success

A successful AI-assisted debugging session should resolve the issue within **3 reasonable attempts** and leave me able to explain the fix without simply copying the AI's explanation.

Target Task 2 — Understanding AI/ML Concepts

What I will do

I will use AI as a learning partner when I encounter difficult AI/ML concepts in university coursework or my FlyRank internship.

I will ask AI to explain the concept in simple language, provide an everyday example, and then help me test my understanding through questions or examples.

Classification

Collaborate with AI

The goal is not for AI to study instead of me. AI will act as a tutor while I remain responsible for learning and understanding the material.

"Done well" means

- I can explain the concept in my own words.
- I can give at least one correct example.
- I can distinguish the concept from a similar concept.
- I can answer at least **3 self-test questions** correctly.
- I do not rely only on the AI-generated explanation.

Measurable success

After an AI-assisted learning session, I should be able to explain the concept without looking at the AI response and score at least **3/4 on a short self-test**.

Target Task 3 — Project and Internship Documentation

What I will do

I will use AI to help turn my rough notes, experiment results, code observations, and findings into clear documentation for my FlyRank internship notebooks and AI/ML projects.

Classification

Delegate to AI with review

AI can produce the first draft, but I will verify every important technical statement and make sure the documentation accurately describes what I actually did.

"Done well" means

- The documentation accurately describes my work.
- It contains no invented results or claims.
- The technical explanation is understandable.
- The important experiment results are included.
- The final version requires only minor editing from me.
- The documentation matches the actual notebook/code.

Measurable success

A successful AI-assisted draft should require **no major factual corrections** and should reduce the time I spend writing documentation by approximately **30% or more** compared with writing the first draft completely myself.

Why I Selected These Three Tasks:

I selected debugging, AI/ML learning, and technical documentation because they occur repeatedly in my university and internship work and have different types of AI involvement.

Debugging allows me to test AI as a technical collaborator. Learning allows me to test AI as a tutor while keeping human understanding and judgment central. Documentation allows me to test delegation while maintaining human review.

Together, these three tasks will help me evaluate whether AI actually improves my speed and quality rather than simply producing more output.

Evidence / Screenshots

AI Toolkit Setup

I set up the following tools for my AI workflow:

- ChatGPT account
- Claude account
- Anthropic Academy account
- Enrolled in AI Fluency: Framework & Foundations
- Completed at least the first module
- Created one Claude Project with custom instructions.

Screenshot 1: ChatGPT Toolkit Account

Evidence of my ChatGPT account and access to the AI toolkit.

Screenshot 2: Claude Project Configuration

Evidence of my configured Claude Project, including the project name, description, and custom instructions.

Screenshot 3: Anthropic Academy Enrollment

Evidence of enrollment in the AI Fluency: Framework & Foundations course.

The screenshot shows the Anthropic Academy user interface. At the top, the 'ANTHROPIC' logo is on the left, and 'Anthropic Academy' and 'Courses' are on the right. Below the logo is a circular profile picture of a man. To the right of the profile picture are four input fields for user information: 'First Name' (Ghulam), 'Last Name' (Qasim), 'Email' (qaximkhaskheli@gmail.com), and 'New Password' (Change your password). Below this is a section titled 'Registrations' which contains a table with the following data:

Title	Enrolled	Status	Completed	Certificate completed	Expiration	Certificate expiration	Receive notifications
AI Fluency: Framework & Foundations	2026-Sep-02	3 of 15 lessons	-	-	-	-	☒

Screenshot 4: Anthropic Academy Module Progress

Evidence of completing the first module of the AI Fluency: Framework Foundations course.

The screenshot shows the Anthropic Academy course progress page. On the left is a sidebar with a list of course modules. The first module, 'Introduction to AI Fluency', is selected and marked with a checkmark. Below it are 'The AI Fluency Framework' and 'Deep Dive 1: What is Generative AI?'. The 'Deep Dive 1' section has two sub-items: 'Generative AI fundamentals' and 'Capabilities & limitations'. At the bottom is 'Delegation'. The main content area shows the '4D Framework' module, which includes a diagram of the 4D Framework and a video of a man speaking. The diagram shows four interconnected boxes: 'Introduction', 'Dissemination', 'Delegation', and 'Dissemination'. The video is titled '4D Framework' and 'Competencies for AI Fluency'.
